

To whom it may concern:

The installation of a smart meter/opt meter is a life and death issue for my family.

My wife and daughter are classified as permanently disabled by the American Government Social Security Administration. Their current health conditions put them at high risk for death or permanent injury from both a smart meter and an opt-out meter. Both the smart meter and the opt-out meter create "dirty electricity". My wife and daughter have been diagnosed with Multiple Chemical Sensitivity along with over a dozen other health complications related to this illness which include autoimmune and neurological illnesses. One of the common complications of Multiple Chemical Sensitivity is Electromagnetic Sensitivity. My daughter's doctor told us that 50% of his patients with Multiple Chemical Sensitivity developed Electromagnet Sensitivity from smart meters/opt out meters once they were installed. Electromagnetic Sensitivity illness is negatively affected by "dirty electricity". My adult daughter's health is very fragile and only weighs 92 pounds. It would only take a short exposure to "dirty electricity" to potentially put her in critical condition. Currently, our meter is located outside the bedroom wall of my daughter's bedroom which increases the dangers of the smart meter/opt out meter. Moving for my wife and daughter is not an option because of the extreme housing accommodations necessary for them to live.

We have contacted Consumers Powers and there doesn't seem to be any program in place for disabled individuals to keep their analog meter.

Attached to this letter is a letter from my daughter's doctor explaining the necessity of keeping an analog meter on our home.

Thank you,

Keith Thornton
